

Predicting House Prices

Kaggle Competition

This Kaggle competition is about predicting house prices based on a set of around 80 predictor variables. Please read the brief description of the project and get familiar with the various predictors. We will have to do some initial cleaning to successfully work with these data. Overall, we (in teams) will use the provided training dataset to build a multiple linear regression model for predicting house prices. Once we have settled on a final model, we will use it with the predictors available in the testing dataset to predict house prices. The goal of the competition mentions that our predictions \hat{y}_i for the houses in the testing data are compared to the (withheld) true selling prices y_i^{test} via $\sum_i (\log \hat{y}_i - \log y_i^{\text{test}})^2$. Because selling prices are typically right-skewed, I think as a first step we will log-transform the selling prices of the houses in the training data to obtain a more bell-shaped distribution. However, although we will build a model for the log-prices, we will still have to submit the price of a house (and not the log-price) to Kaggle, together with the ID of the house.

Loading and inspecting the train and test datasets

## i Specify the column types or set 'show_col_types = FALSE' to quiet this message.
```

```
dim(train)
```

```
## [1] 1460 81
```

```
## Load Testing Data
path_testdata <- 'https://raw.githubusercontent.com/bklingen/Price-Prediction/main/test.csv'
test <- read_csv(path_testdata)
```

```
## Rows: 1459 Columns: 80
## -- Column specification -----
## Delimiter: ","
## chr (43): MSZoning, Street, Alley, LotShape, LandContour, Utilities, LotConf...
## dbl (37): Id, MSSubClass, LotFrontage, LotArea, OverallQual, OverallCond, Ye...
##
## i Use 'spec()' to retrieve the full column specification for this data.
## i Specify the column types or set 'show_col_types = FALSE' to quiet this message.
```

```
dim(test)
```

```
## [1] 1459 80
```

```
SalePrice <- train$SalePrice
```

This makes sense: We have one less column in test data because of the missing house prices.

But, are the column names the same? Let's find the "difference" between two sets: All the column names that are in the test data but not in the train data:

```
setdiff(colnames(test), colnames(train))
```

```
## character(0)
```

OK, good, and now the other way around:

```
setdiff(colnames(train), colnames(test))
```

```
## [1] "SalePrice"
```

OK, great. So no surprises there. All predictors that exist in the train data set also appear in the test dataset.

Let's see how many quantitative and how many categorical predictors we have in the training dataset, at least at face value:

```
train_quantPredictors = train %>% select(where(is.numeric)) %>% select(-SalePrice)
train_catPredictors = train %>% select(where(is.character))
dim(train_quantPredictors)
```

```
## [1] 1460 37
```

```
dim(train_catPredictors)
```

```
## [1] 1460 43
```

Let's quickly do the same split for the test data:

```
test_quantPredictors = test %>% select(where(is.numeric))
test_catPredictors = test %>% select(where(is.character))
```

Let's transform the categorical predictors into factors, which should make it easier to combine categories, create a category like "other", etc.

```
train_catPredictors = train_catPredictors %>% transmute_all(as.factor)
test_catPredictors = test_catPredictors %>% transmute_all(as.factor)
```

First, let's see the category names and frequency for each variable:

```
for(i in 1:ncol(train_catPredictors)) {
  print(colnames(train_catPredictors)[i])
  print("----")
  print(as.data.frame(fct_count(unlist(train_catPredictors[,i]))))
  print("-----")
}
```

Richard's Features

RoofStyle

combine flat, shed as other; gambrel, mansard, gable as gable; leave others as is

```
roof_price <- train %>% group_by(RoofStyle) %>% summarize(count=n(),  
  mean(SalePrice), sd(SalePrice))
```

```
roof_price
```

```
## # A tibble: 6 x 4  
##   RoofStyle count 'mean(SalePrice)' 'sd(SalePrice)'  
##   <chr>      <int>          <dbl>          <dbl>
```

```
## 1 Flat      13      194690      62523.
## 2 Gable    1141      171484.      66331.
## 3 Gambrel   11      148909.      67014.
## 4 Hip      286      218877.      111550.
## 5 Mansard   7      180568.      58058.
## 6 Shed      2      225000      49497.
```

```
train$RoofStyle <- fct_collapse(train$RoofStyle, Other = c("Flat", "Shed"))
train$RoofStyle <- fct_collapse(train$RoofStyle, Gable = c("Gable", "Gambrel", "Mansard"))
```

Let's do the same on the testing dataset:

```
test$RoofStyle <- fct_collapse(test$RoofStyle, Other = c("Flat", "Shed"))
test$RoofStyle <- fct_collapse(test$RoofStyle, Gable = c("Gable", "Gambrel", "Mansard"))
```

BldgType

Combine 2FmCon, Duplex as multifamily; leave others as is

```
bldg_price <- train %>% group_by(BldgType) %>% summarize(count=n(),
  mean(SalePrice), sd(SalePrice))
```

```
bldg_price
```

```
## # A tibble: 5 x 4
##   BldgType count 'mean(SalePrice)' 'sd(SalePrice)'
##   <chr>      <int>          <dbl>          <dbl>
## 1 1Fam      1220      185764.      82649.

## 4 Twnhs     43      135912.      41013.
## 5 TwnhsE    114      181959.      60626.
```

```
train$BldgType <- fct_collapse(train$BldgType, MultiFam = c("2fmCon", "Duplex"))
```

Let's do the same on the testing dataset:

```
test$BldgType <- fct_collapse(test$BldgType, MultiFam = c("2fmCon", "Duplex"))
```

HouseStyle

Combine 1.5Fin, 1Story, split foyer, split level as less than 2 story; 2.5fin, 2Story as two story or greater; leave 1.5Unf and 2.5Unf as is since they drag down property values

```
style_price <- train %>% group_by(HouseStyle) %>% summarize(count=n(),
  mean(SalePrice), sd(SalePrice))
```

```
style_price
```

```
## # A tibble: 8 x 4
##   HouseStyle count 'mean(SalePrice)' 'sd(SalePrice)'
##   <chr>      <int>      <dbl>      <dbl>
## 1 1.5Fin      154      143117.    54278.
## 2 1.5Unf       14      110150     19036.
## 3 1Story      726      175985.    77056.
## 4 2.5Fin        8      220000     118212.
## 5 2.5Unf       11      157355.    63934.
## 6 2Story      445      210052.    87339.
## 7 SFoyer       37      135074.    30481.
## 8 SLvl        65      166703.    38305.
```

```
train$HouseStyle <- fct_collapse(train$HouseStyle, Less2story = c("1Story", "1.5Fin", "SFoyer", "SLvl"),
train$HouseStyle <- fct_collapse(train$HouseStyle, EqMore2story = c("2Story", "2.5Fin"))
```

And on the test data:

```
test$HouseStyle <- fct_collapse(test$HouseStyle, Less2story = c("1Story", "1.5Fin", "SFoyer", "SLvl"))
test$HouseStyle <- fct_collapse(test$HouseStyle, EqMore2story = c("2Story", "2.5Fin"))
```

```
## Warning: Unknown levels in 'f': 2.5Fin
```

Kyle:

```
cleanpool <- as.character(train_catPredictors$PoolQC)
cleanpool[is.na(cleanpool)] <- "none"
cleanpool <- as.factor(cleanpool)
```

```
cleanfence <- as.character(train_catPredictors$Fence)
cleanfence[is.na(cleanfence)] <- "none"
cleanfence <- as.factor(cleanfence)
```

```
cleanfunc <- as.character(train_catPredictors$Functional)
cleanfunc[cleanfunc == 'Min1' | cleanfunc == 'Min2'] <- "Minor"
cleanfunc[cleanfunc == 'Maj1' | cleanfunc == 'Maj2'] <- "Major"
cleanfunc[cleanfunc == 'Sev' | cleanfunc == 'Sal'] <- "Severe"
cleanfunc <- as.factor(cleanfunc)
```

```
train$PoolQC <- cleanpool
train$Fence <- cleanfence
train$Functional <- cleanfunc
```

We need to do the same for the test dataset, so I just copied the code block and replaced “train” by “test”:

```
cleanpool <- as.character(test_catPredictors$PoolQC)
cleanpool[is.na(cleanpool)] <- "none"
cleanpool <- as.factor(cleanpool)
```

```
cleanfence <- as.character(test_catPredictors$Fence)
cleanfence[is.na(cleanfence)] <- "none"
cleanfence <- as.factor(cleanfence)
```

```
cleanfunc <- as.character(test_catPredictors$Functional)
cleanfunc[cleanfunc == 'Min1' | cleanfunc == 'Min2'] <- "Minor"
cleanfunc[cleanfunc == 'Maj1' | cleanfunc == 'Maj2'] <- "Major"
cleanfunc[cleanfunc == 'Sev' | cleanfunc == 'Sal'] <- "Severe"
cleanfunc <- as.factor(cleanfunc)
```

```
test$PoolQC <- cleanpool
test$Fence <- cleanfence
test$Functional <- cleanfunc
```

Mileva: Heating, Electrical, FireplaceQu, HeatingQC, CentralAir

The processing for the Heating, Electrical, and FireplaceQu predictors is below. The HeatingQC and CentralAir predictors did not require any additional processing.

```
# Heating: Collapsed categories with low frequencies into "other"
heating <- as.factor(train_catPredictors$Heating)
heating <- fct_other(heating, keep=c("GasA", "GasW"))
train$Heating <- heating
```

```
# Electrical: Collapsed similar categories together and handled missing values
electrical <- as.character(train_catPredictors$Electrical)

electrical <- fct_collapse(electrical, Fuse=c("FuseA", "FuseF", "FuseP"))
electrical <- fct_collapse(electrical, Other=c("Mix"))
electrical[is.na(electrical)] <- "Other"

train$Electrical <- electrical
```

```
# Fireplace: Handled missing values
fireplace <- as.character(train_catPredictors$FireplaceQu)
fireplace[is.na(fireplace)] <- "none"
train$FireplaceQu <- as.factor(fireplace)
```

Need to do the same for test dataset:

```
# Heating: Collapsed categories with low frequencies into "other"
heating <- as.factor(test_catPredictors$Heating)
heating <- fct_other(heating, keep=c("GasA", "GasW"))
test$Heating <- heating
```

```
# Electrical: Collapsed similar categories together and handled missing values
electrical <- as.character(test_catPredictors$Electrical)

electrical <- fct_collapse(electrical, Fuse=c("FuseA", "FuseF", "FuseP"))
electrical <- fct_collapse(electrical, Other=c("Mix"))
```

```
## Warning: Unknown levels in 'f': Mix
```

```
electrical[is.na(electrical)] <- "Other"
```

```
## Warning in '[<-factor'('*tmp*', is.na(electrical), value = "Other"): invalid  
## factor level, NA generated
```

```
test$Electrical <- electrical
```

```
# Fireplace: Handled missing values  
fireplace <- as.character(test_catPredictors$FireplaceQu)  
fireplace[is.na(fireplace)] <- "none"  
test$FireplaceQu <- as.factor(fireplace)
```

Thomas: RoofMatl, Exterior1st/Exterior2nd, SaleType

RoofMatl - Dropped

1434/1460 entries in the training set are CompShg.

The off-materials aren't meaningfully different price-wise as an 'other' group. Wood Shingles ('wdshngl') does contain 2 houses in the 99th percentile sale price, but with only 6 entries I don't think it's safe to include.

I think we're better off dropping this one.

```
train <- select(train, -c(RoofMatl))  
test <- select(test, -c(RoofMatl))
```

Exterior1st/2nd

Fixed the following label mis-matches between columns: Exterior1st - WdShng, CemntBd, BrkComm, Exterior2nd - Wd Shng, CmentBd, Brk Cmn

~90% of these two variables matched. In the ~10% that didn't match, Exterior1st is generally a better predictor of sale price than Exterior2nd. I converted Exterior2nd into a boolean, TRUE if Exterior1st != Exterior2nd.

I combined the bottom half of Exterior1st's categories into an 'Other' category. (This leaves 7, but Brick Face/Cement Board seem to be decent categories for predicting sale price, so I didn't want to drop them.)

```
train$Exterior2nd[train$Exterior2nd=='Wd Shng'] <- 'WdShing'  
train$Exterior2nd[train$Exterior2nd=='CmentBd'] <- 'CemntBd'  
train$Exterior2nd[train$Exterior2nd=='Brk Cmn'] <- 'BrkComm'  
train$Exterior2nd <- train$Exterior1st!=train$Exterior2nd  
train$Exterior1st <- fct_collapse(train$Exterior1st, Other = c("AsbShng", "AsphShn", "CBlock", "ImStucc", "Brk Face", "CmentBd", "BrkComm"))  
  
test$Exterior2nd[test$Exterior2nd=='Wd Shng'] <- 'WdShing'  
test$Exterior2nd[test$Exterior2nd=='CmentBd'] <- 'CemntBd'  
test$Exterior2nd[test$Exterior2nd=='Brk Cmn'] <- 'BrkComm'  
test$Exterior2nd <- test$Exterior1st!=test$Exterior2nd  
test$Exterior1st <- fct_collapse(test$Exterior1st, Other = c("AsbShng", "AsphShn", "CBlock", "ImStucc", "Brk Face", "CmentBd", "BrkComm"))
```

```
## Warning: Unknown levels in 'f': ImStucc, Stone
```

Bernhard: I also changed ExterCond:

```
table(train$ExterCond)
```

```
##
##   Ex   Fa   Gd   Po   TA
##    3   28  146    1 1282
```

```
table(test$ExterCond)
```

```
##
##   Ex   Fa   Gd   Po   TA
##    9   39  153    2 1256
```

Po and Ex are rather uncommon, so we collapse them all into “other”:

```
train$ExterCond = fct_collapse(train$ExterCond, other=c("Ex", "Po"))
test$ExterCond = fct_collapse(test$ExterCond, other=c("Ex", "Po"))

summary(train$ExterCond)
```

```
## other    Fa    Gd    TA
##     4     28   146  1282
```

```
summary(test$ExterCond)
```

```
## other    Fa    Gd    TA
##    11     39   153  1256
```

SaleType

WD, New, and Court deed/estate were the three most common categories, and all 3 were significant when using SaleType as sole predictor. Combined the other categories into ‘Other’.

```
train$SaleType <- fct_collapse(train$SaleType, Other = c("ConLD", "ConLw", "ConLI", "CWD", "Oth", "Con"))
test$SaleType <- fct_collapse(test$SaleType, Other = c("ConLD", "ConLw", "ConLI", "CWD", "Oth", "Con"))
```

Marina: Neighborhood, GarageType, GarageFinish, GarageQual, GarageCond

# - None and TA remains the same
```

```
garageCond <- fct_collapse(garageCond, Gd = c("Ex", "Gd"))
garageCond <- fct_collapse(garageCond, Po = c("Fa", "Po"))
```

```
#Update column with new values
test$GarageCond <- garageCond
```

Note: We also need to discuss the NA's in the numerical variable GarageYrBlt, see later.

Paul: LotShape, LotConfig, LandContour

Fortunately there are no NA values in either the test or train sets.

```
sum(is.na(train$LotShape))
```

```
## [1] 0
```

```
sum(is.na(test$LotShape))
```

```
## [1] 0
```

```
sum(is.na(train$LotConfig))
```

```
## [1] 0
```

```
sum(is.na(test$LotConfig))
```

```
## [1] 0
```

```
sum(is.na(train$LandContour))
```

```
## [1] 0
```

```
sum(is.na(test$LandContour))
```

```
## [1] 0
```

```
fct_count(train$LotShape)
```

```

## 1 Bnk     54
## 2 HLS     70
## 3 Low     24
## 4 Lvl    1311
```

All of these variables are highly imbalanced. In each there is one category that represents a “regular” shape, configuration, or land contour, which amount for ~2/3 or more of the total instances. Thus, I collapsed all of the less represented “irregular” categories into one.

```
train$LotShape <- fct_collapse(train$LotShape, Irregular = c("IR1", "IR2", "IR3"))
train$LotConfig <- fct_collapse(train$LotConfig, Other = c("Corner", "CulDSac", "FR2", "FR3"))
train$LandContour <- fct_collapse(train$LandContour, NonLvl = c("Bnk", "HLS", "Low"))
```

```
fct_count(train$LotShape)
```

```
## # A tibble: 2 x 2
##   f         n
##   <fct>   <int>
## 1 Irregular 535
## 2 Reg      925
```

```
fct_count(train$LotConfig)
```

```
## # A tibble: 2 x 2
##   f         n
##   <fct>   <int>
## 1 Other   408
## 2 Inside 1052
```

```
fct_count(train$LandContour)
```

```
## # A tibble: 2 x 2
##   f         n
##   <fct>   <int>
## 1 NonLvl  149
## 2 Lvl    1311
```

Need to do the same for the test data:

```
test$LotShape <- fct_collapse(test$LotShape, Irregular = c("IR1", "IR2", "IR3"))
test$LotConfig <- fct_collapse(test$LotConfig, Other = c("Corner", "CulDSac", "FR2", "FR3"))
test$LandContour <- fct_collapse(test$LandContour, NonLvl = c("Bnk", "HLS", "Low"))
```

First Try for building a predictive model, using just one variable, but as a smooth function:

```
library(splines)
plot(train$SalePrice ~ train$GrLivArea)
```

```
plot(log(train$SalePrice) ~ train$GrLivArea)
```

Better to log-transform response

```
fit1 = lm(log(SalePrice) ~ ns(GrLivArea, df=10), data=train)
seqGrLivArea = seq(min(train$GrLivArea), max(train$GrLivArea), length.out=200)
predictedSpline = predict(fit1, newdata = data.frame(GrLivArea=seqGrLivArea))
ggplot(data=train,
       aes(x=GrLivArea,
           y=log(SalePrice)
        )
    ) +
  geom_point(pch=21, fill="red", size=1.2, alpha=0.5) +
  geom_line(
    data = data.frame(
      x = seqGrLivArea,
      y = predictedSpline
    ),
    aes(
      x=x,
      y=y
    ),
    color = "blue", size = 1
  )
```

Preparing the dataset with the predicted sale prices for the test data:

```
predicted.SalePrice = exp(predict(fit1, newdata=data.frame(GrLivArea = test$GrLivArea)))
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice)
# write.csv(file='C:\\Teaching\\NewCollege\\StatsTopics\\Submission1.csv', SubmitDF, row.names = FALSE)
```

Submitting this file to the Kaggle competition, I obtained a “Prediction error”, measures as

$$\sum (\log(\hat{y}_i) - \log(y_i))^2$$

of 0.28857, where \hat{y}_i is my prediction of the sale price of the i th house in the test data, and y_i is the actual sale price only known to Kaggle.

Second Try, including all predictors!

If we include all predictors, one issue is that a few predictors might have a lot of NA values, and then the corresponding observation is not used in the fit. (You find this out when you try to fit the full model.) Let’s see which variables have the most NA’s.

```
train %>%
  summarize(across(everything(), ~sum(is.na(.x)))) %>%
  sort(decreasing=TRUE)
```

```
## Warning in xtfm.data.frame(x): cannot xtfm data frames
```

```
## # A tibble: 1 x 80
##   MiscFe~1 Alley LotFr~2 Garag~3 BsmtE~4 BsmtF~5 BsmtQ~6 BsmtC~7 BsmtF~8 MasVn~9
##   <int> <int>   <int>   <int>   <int>   <int>   <int>   <int>   <int>   <int>
## 1    1406  1369     259     81     38     38     37     37     37     8
## # ... with 70 more variables: MasVnrArea <int>, Id <int>, MSSubClass <int>,
## #   MSZoning <int>, LotArea <int>, Street <int>, LotShape <int>,
## #   LandContour <int>, Utilities <int>, LotConfig <int>, LandSlope <int>,
## #   Neighborhood <int>, Condition1 <int>, Condition2 <int>, BldgType <int>,
## #   HouseStyle <int>, OverallQual <int>, OverallCond <int>, YearBuilt <int>,
## #   YearRemodAdd <int>, RoofStyle <int>, Exterior1st <int>, Exterior2nd <int>,
## #   ExterQual <int>, ExterCond <int>, Foundation <int>, BsmtFinSF1 <int>, ...
```

```
dim(train)
```

```
## [1] 1460   80
```

For the variable `MiscFeature`, almost all values are missing. However, looking in the data description file, this actually means that the house simply doesn't have any other features. So, we set the NA's to "none", in both the train and test datasets. The same applies to `Alley`, where an NA means "none":

```
train$MiscFeature = fct_explicit_na(train$MiscFeature, na_level="none")
test$MiscFeature = fct_explicit_na(test$MiscFeature, na_level="none")

train$Alley = fct_explicit_na(train$Alley, na_level="none")
test$Alley = fct_explicit_na(test$Alley, na_level="none")
```

For `LotFrontage`, the missing values are genuine. (But lets hope that the value being missing has no connection to the sales price of a house.)

Another issue with fitting a full model is the number of unique values a predictor has. If it only has **one unique value (or one unique factor level)**, then it doesn't vary, i.e., it is a constant. This causes issues because then the design matrix X is not full rank. The column for the intercept is a column of all 1's, and then each column for a predictor which is constant is also a column of a fixed number. This causes a linear dependency between these columns, and the design matrix is not full rank.

First, lets turn the character variables into factors, both in the training and testing data. This will pay off later:

```
train = train %>% mutate(across(where(is.character), as.factor))
test = test %>% mutate(across(where(is.character), as.factor))
```

Let's find the predictors which have constant values throughout:

```
train %>%
  summarize(across(everything(), ~length(unique(.x)))) %>%
  sort()
```

```
## Warning in xtfrm.data.frame(x): cannot xtfrm data frames
```

```
## # A tibble: 1 x 80
##   Street LotShape LandCo~1 Utili~2 LotCo~3 Exter~4 Centr~5 Alley LandS~6 RoofS~7
##   <int>   <int>   <int>   <int>   <int>   <int>   <int> <int>   <int>   <int>
```

```
## 1      2      2      2      2      2      2      2      3      3      3
## # ... with 70 more variables: Heating <int>, Electrical <int>,
## #   BsmtHalfBath <int>, HalfBath <int>, PavedDrive <int>, MSSubClass <int>,
## #   MSZoning <int>, Condition1 <int>, Condition2 <int>, BldgType <int>,
## #   HouseStyle <int>, ExterQual <int>, ExterCond <int>, BsmtFullBath <int>,
## #   FullBath <int>, KitchenAbvGr <int>, KitchenQual <int>, Fireplaces <int>,
## #   GarageFinish <int>, GarageQual <int>, GarageCond <int>, PoolQC <int>,
## #   SaleType <int>, MasVnrType <int>, BsmtQual <int>, BsmtCond <int>, ...
```

There doesn't seem to be a variable that has only one unique value or one unique factor level. So we should be good to go.

Having done/checked all that, we are ready to fit the full model with all variables. However, using `> fit2 = lm(log(SalePrice) ~ . , data=train %>% select(-Id, -SalePrice))`, I ran into a problem, where R shows the error message `contrasts can be applied only to factors with 2 or more levels`.

With trial and error, I saw that we can fit a model with the first 8 predictors, but when we include 'Utilities', there is an issue

```
fit2 = lm(log(train$SalePrice) ~ . , data=train[,2:9])
summary(fit2)
```

```
##
## Call:
## lm(formula = log(train$SalePrice) ~ . , data = train[, 2:9])
##

```

What is going on with utilities:

```
summary(train$Utilities)
```

```
## AllPub NoSeWa
##    1459      1
```

We see that it is almost constant! There is only one observation with a different utility type. Probably, that observation has some missing values on some other variables, and hence is removed from the design matrix, making it an all constant predictor. Let's check:

```
train[train$Utilities == 'NoSeWa',]
```

```
## # A tibble: 1 x 80
##   Id MSSubClass MSZon~1 LotFr~2 LotArea Street Alley LotSh~3 LandC~4 Utili~5
##   <dbl> <fct>      <fct>      <dbl>  <dbl> <fct>  <fct> <fct>  <fct>  <fct>
## 1   945 1-story si~ RL          NA   14375 Pave   none Irregu~ Lvl    NoSeWa
## # ... with 70 more variables: LotConfig <fct>, LandSlope <fct>,
## #   Neighborhood <fct>, Condition1 <fct>, Condition2 <fct>, BldgType <fct>,
## #   HouseStyle <fct>, OverallQual <dbl>, OverallCond <dbl>, YearBuilt <dbl>,
## #   YearRemodAdd <dbl>, RoofStyle <fct>, Exterior1st <fct>, Exterior2nd <lgl>,
## #   MasVnrType <fct>, MasVnrArea <dbl>, ExterQual <fct>, ExterCond <fct>,
## #   Foundation <fct>, BsmtQual <fct>, BsmtCond <fct>, BsmtExposure <fct>,
## #   BsmtFinType1 <fct>, BsmtFinSF1 <dbl>, BsmtFinType2 <fct>, ...
```

There we go, `LotFrontage` is NA for this particular house, so it is removed, and the remaining houses all have the same utility type.

Removing/Replacing Missing Values

It is best to get the training dataset that has no missing values (since they will be discarded in the fitting process of the full model anyway), and then check if any other predictors are constant. Which variables still have a lot of missing values:

```
train %>%
  summarize(across(everything(), ~sum(is.na(.x)))) %>%
  sort(decreasing = TRUE)
```

```
## Warning in xtfrm.data.frame(x): cannot xtfrm data frames
```

```
## # A tibble: 1 x 80
##   LotFro~1 Garag~2 BsmtE~3 BsmtF~4 BsmtQ~5 BsmtC~6 BsmtF~7 MasVn~8 MasVn~9 Id
##   <int> <int> <int> <int> <int> <int> <int> <int> <int> <int>
## 1     259      81      38      38      37      37      37      8      8      0
## # ... with 70 more variables: MSSubClass <int>, MSZoning <int>, LotArea <int>,
## #   Street <int>, Alley <int>, LotShape <int>, LandContour <int>,
## #   Utilities <int>, LotConfig <int>, LandSlope <int>, Neighborhood <int>,
## #   Condition1 <int>, Condition2 <int>, BldgType <int>, HouseStyle <int>,
## #   OverallQual <int>, OverallCond <int>, YearBuilt <int>, YearRemodAdd <int>,
## #   RoofStyle <int>, Exterior1st <int>, Exterior2nd <int>, ExterQual <int>,
## #   ExterCond <int>, Foundation <int>, BsmtFinSF1 <int>, BsmtFinSF2 <int>, ...
```

For now, I'm going to drop `LotFrontage` from consideration, although we could impute values. I'm also going to drop `GarageYrBlt` from consideration, because it has around 80 missing values for those garages where there is no information. Since we have info on the garage from other variables, I rather keep 81 observations in the dataset, but not include `GarageYrBlt`. So, I'm going to drop `GarageYrBlt` from the list of predictors:

```
train = train %>% select(-LotFrontage, -GarageYrBlt)
test = test %>% select(-LotFrontage, -GarageYrBlt)
```

We now need to handle the Basement values. We need to replace the NA's with "none":

```
train$BsmtQual = fct_explicit_na(train$BsmtQual, na_level="none")
train$BsmtCond = fct_explicit_na(train$BsmtCond, na_level="none")
train$BsmtExposure = fct_explicit_na(train$BsmtExposure, na_level="none")
train$BsmtFinType1 = fct_explicit_na(train$BsmtFinType1, na_level="none")
train$BsmtFinType2 = fct_explicit_na(train$BsmtFinType2, na_level="none")

test$BsmtQual = fct_explicit_na(test$BsmtQual, na_level="none")
test$BsmtCond = fct_explicit_na(test$BsmtCond, na_level="none")
test$BsmtExposure = fct_explicit_na(test$BsmtExposure, na_level="none")
test$BsmtFinType1 = fct_explicit_na(test$BsmtFinType1, na_level="none")
test$BsmtFinType2 = fct_explicit_na(test$BsmtFinType2, na_level="none")

train %>%
  summarize(across(everything(), ~sum(is.na(.x)))) %>%
  sort(decreasing = TRUE)
```

```
## Warning in xtfrm.data.frame(x): cannot xtfrm data frames
```

```
## # A tibble: 1 x 78
##   MasVnrType MasVnr~1 Id MSSub~2 MSZon~3 LotArea Street Alley LotSh~4 LandC~5
##   <int> <int> <int> <int> <int> <int> <int> <int> <int> <int>
## 1      8      8      0      0      0      0      0      0      0      0
```

```
## # ... with 68 more variables: Utilities <int>, LotConfig <int>,
## #   LandSlope <int>, Neighborhood <int>, Condition1 <int>, Condition2 <int>,
## #   BldgType <int>, HouseStyle <int>, OverallQual <int>, OverallCond <int>,
## #   YearBuilt <int>, YearRemodAdd <int>, RoofStyle <int>, Exterior1st <int>,
## #   Exterior2nd <int>, ExterQual <int>, ExterCond <int>, Foundation <int>,
## #   BsmtQual <int>, BsmtCond <int>, BsmtExposure <int>, BsmtFinType1 <int>,
## #   BsmtFinSF1 <int>, BsmtFinType2 <int>, BsmtFinSF2 <int>, ...
```

For MasVnrType, I will introduce a new category “missing”, but for MasVnrArea I will just input 0 for those 8 missing areas:

```
summary(train$MasVnrType)
```

```
## BrkCmn BrkFace      None      Stone      NA's
##      15      445      864      128      8
```

```
train$MasVnrType = fct_explicit_na(train$MasVnrType, na_level="missing")
train$MasVnrArea[is.na(train$MasVnrArea)] = 0

test$MasVnrType = fct_explicit_na(test$MasVnrType, na_level="missing")
test$MasVnrArea[is.na(test$MasVnrArea)] = 0
```

We now have no missing predictor values in the training data:

```
dim(train)
```

```
## [1] 1460   78
```

```
dim(train %>% drop_na())
```

```
## [1] 1460   78
```

Let’s now revisit check if any predictors are constant:

```
train %>%
  summarize(across(everything(), ~length(unique(.x)))) %>%
  sort()
```

```
## Warning in xtfrm.data.frame(x): cannot xtfrm data frames
```

```
## # A tibble: 1 x 78
##   Street LotShape LandCo~1 Utili~2 LotCo~3 Exter~4 Centr~5 Alley LandS~6 RoofS~7
##   <int>   <int>   <int>   <int>   <int>   <int>   <int> <int>   <int>   <int>
## 1     2     2     2     2     2     2     2     3     3     3
## # ... with 68 more variables: Heating <int>, Electrical <int>,
## #   BsmtHalfBath <int>, HalfBath <int>, PavedDrive <int>, MSSubClass <int>,
## #   MSZoning <int>, Condition1 <int>, Condition2 <int>, BldgType <int>,
## #   HouseStyle <int>, ExterQual <int>, ExterCond <int>, BsmtFullBath <int>,
## #   FullBath <int>, KitchenAbvGr <int>, KitchenQual <int>, Fireplaces <int>,
## #   GarageFinish <int>, GarageQual <int>, GarageCond <int>, PoolQC <int>,
## #   SaleType <int>, MasVnrType <int>, BsmtQual <int>, BsmtCond <int>, ...
```

Seems fine, although for Utilities:

```
summary(train$Utilities)
```

```
## AllPub NoSeWa
##    1459      1
```

This means we also need to drop Utilities from the test data.

```
train = train %>% select(-Utilities)
test = test %>% select(-Utilities)
```

NA's in Test Data

Just like in the training dataset, we might have some NA's in the test data:

```
isNAtest = apply(test,1,function(x) any(is.na(x)))
sum(isNAtest)
```

```
## [1] 11
```

We still have 11 observations with at least one missing predictor. This is a problem since when we use all predictors, we will not be able to obtain a predicted sales price for these 11 houses. Which predictors have the most missing values:

```
test %>%
  summarize(across(everything(), ~sum(is.na(.x)))) %>%
  sort(decreasing = TRUE)
```

```
## Warning in xtfrm.data.frame(x): cannot xtfrm data frames
```

```
## # A tibble: 1 x 76

```

```
test$SaleType[is.na(test$SaleType)] = "Other"
```

Fitting the model with almost all variables

We can now fit the full model:

```
SalePrice = train$SalePrice  
HouseId = train$Id #just in case we need it  
train = train %>% select(-Id, -SalePrice)  
fit2 = lm(log(SalePrice) ~ . , data=train)
```

We can now try to predict the sales price based on the variables in the test data, since we have addressed all missing values in the test data:

```
predicted.SalePrice2 = exp(predict(fit2, newdata=test))
```

```
## Warning in predict.lm(fit2, newdata = test): prediction from a rank-deficient  
## fit may be misleading
```

Preparing the dataset with the predicted sale prices for the test data:

```
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice2)  
# write.csv(file='C:\\Teaching\\NewCollege\\StatsTopics\\Submission2.csv', SubmitDF, row.names = FALSE)
```

Interestingly, using all these variables, the prediction score did not go down by much. It is now 0.26450. What is the relationship between our predictions based on the two models:

```
plot(predicted.SalePrice2 ~ predicted.SalePrice)
```

This is pretty telling. Just for a few houses (three), we predicted a much higher price with the second model compared to the first. Which houses are these:

```
SubmitDF %>% slice_max(SalePrice,n=8)
```

```
##      Id  SalePrice  
## 1140 2600 22261168.2  
## 1044 2504  9924031.0  
##  961 2421  3808022.8
```

```
## 1090 2550 1204635.6
## 1251 2711 932354.8
## 1223 2683 618442.0
## 1168 2628 538556.1
## 20 1480 516352.8
```

For the house with ID 2600 in the test data, we predicted a sales price of over 22 million! The error alone in this prediction could be huge! To find out, I'm replacing just the prediction for the 5 most expensive predicted prices with the maximum sales price found in the training data.

```
SubmitDF$SalePrice[SubmitDF$Id %in% c(2600, 2504, 2421, 2550, 2711)] = max(SalePrice)
# write.csv(file='C:\\Teaching\\NewCollege\\StatsTopics\\Submission3.csv', SubmitDF, row.names = FALSE)
```

Yes, the prediction error went down to 0.19609!

Where our work begins

using AIC to determine best model

```
library(stats)
```

```

```

predict test set results using trained linear model

```
predicted.SalePrice3 = exp(predict(train.highF, newdata=test))
```

create data frame of IDs and predicted Sale Prices, write to csv

```
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice3)
write.csv(file='~/Submission_LRB.csv', SubmitDF, row.names = FALSE)
```

.19457 which is better!

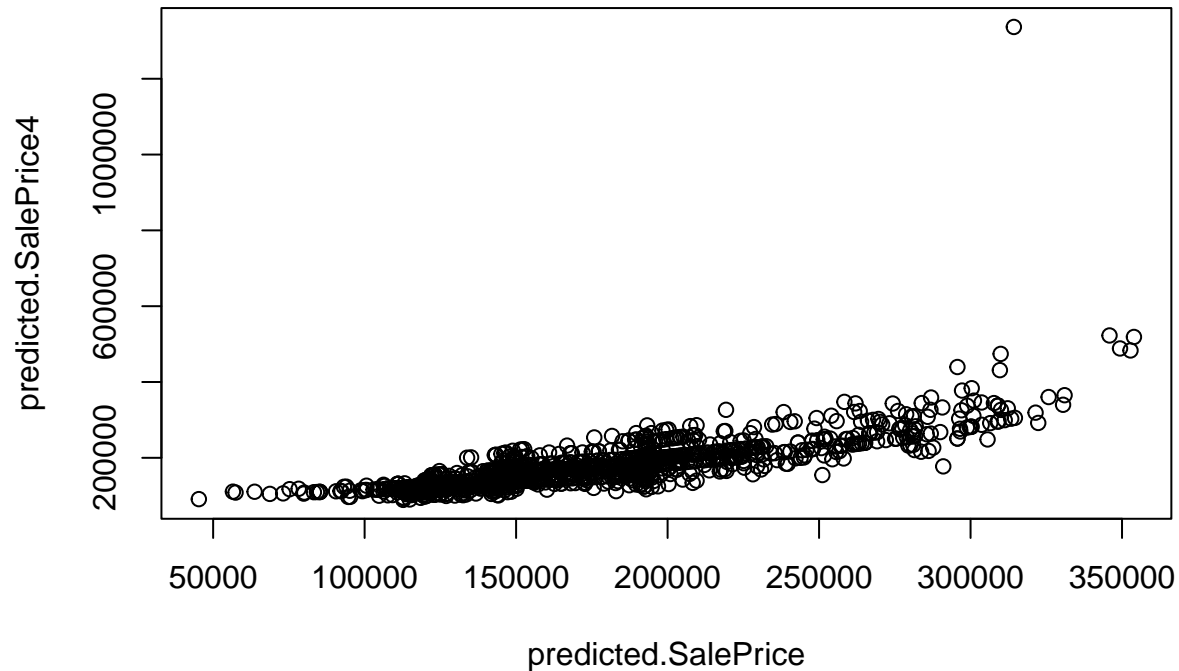

Next going to try and choose my own predictors.

```
fit4 = lm(formula = log(SalePrice) ~ SaleType+SaleCondition+FullBath+BedroomAbvGr+GrLivArea, data = tr
```

```
predicted.SalePrice4 = exp(predict(fit4, newdata=test))
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice4)
write.csv(file='C:/Users/rodri/Desktop/Submission4.csv', SubmitDF, row.names = FALSE)
```

```
plot(predicted.SalePrice4 ~ predicted.SalePrice)
```

This should be worse than our previous model.
0.26267 which it is.

Lets Try Splines

using the earth library to do Multivariate Adaptive Regression
Splines(MARS)

```
library(earth)
```

```

```
## The following object is masked from 'package:purrr':
##
##      partial
```

```
p1 <- vip(fit6, num_features = 40, bar = FALSE, value = "gcv") + ggtitle("GCV")
p2 <- vip(fit6, num_features = 40, bar = FALSE, value = "rss") + ggtitle("RSS")
gridExtra::grid.arrange(p1, p2, ncol = 2)
```

Trying MARS with our AIC model

```
fit6 <- earth(log(SalePrice)~OverallQual+GrLivArea+YearBuilt+BsmFinSF1+OverallCond+`2ndFlrSF`+LotArea+
```

```
predicted.SalePrice6 = exp(predict(fit6, newdata=test))
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice6)
names(SubmitDF)[2]<-"SalePrice"
write.csv(file='C:/Users/rodri/Desktop/Submission6.csv', SubmitDF, row.names = FALSE)
```

```
plot(predicted.SalePrice6 ~ predicted.SalePrice)
```

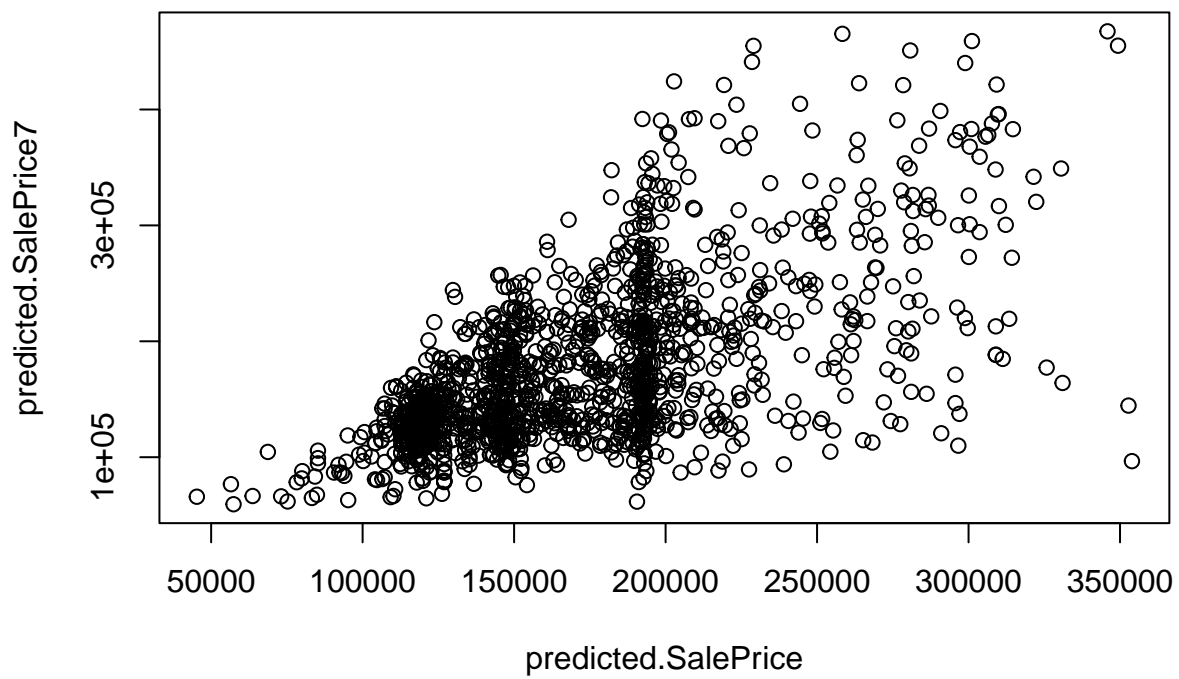

0.13586 worse than before. I think this is pretty good.

Trying MARS with our trimmed down model which was the best performance model before MARS

```
fit7 <- earth(log(SalePrice)~ LotArea + OverallQual + YearBuilt + Neighborhood + KitchenQual + LotArea*)
```

```
predicted.SalePrice7 = exp(predict(fit7, newdata=test))
SubmitDF = data.frame(Id=test$Id, SalePrice=predicted.SalePrice7)
names(SubmitDF)[2]<-"SalePrice"
write.csv(file='C:/Users/rodri/Desktop/Submission7.csv', SubmitDF, row.names = FALSE)
```

```
plot(predicted.SalePrice7 ~ predicted.SalePrice)
```

0.18318 interesting how splines plus best performing model turns out to be worse than using all the predictors.
